Link your Local PC Folder with a GitHub Repository and PUSH Updates using Commands

1. Install Required Tools

Make sure you have:

- Git installed
- GitHub account

2. Initialize Your Local Folder

Open folder with VS Code

3. Initialize Git in your folder

Open terminal window and run below command

```
git init
```

This command will connect your folder to Git tracking.

4. Connect to GitHub Repository

Create a new repository on GitHub (empty repo) and get its link

Run below command. In this command, write link of you repo.

```
git remote add origin https://github.com/your-username/repo-name
```

5. First Time Push

Run below commads one by one. First time, you will have to run all commands.

These command will add files, commit, and push the code

```
git add .
```

Copy

```
git commit -m "Initial commit"
```

Copy

```
git branch -M main
```

Copy

```
git push -u origin main
```

Now your folder is connected to GitHub, if there is not error after running above commands

6. Update the Code/Files

Whenever you make changes in your code, then you will have to run below THREE commands one by one.

```
git add .
```

Copy

```
git commit -m "you can write somethings here as comment"
```

Copy

```
git push -u origin main
```

Fixing Some Errors if Happens.

Step 1: Configure Git username and email

Run these commands with your actual GitHub information:

```
git config --global user.name "Muhammad"
git config --global user.email "your-email@example.com"
```

Replace `your-email@example.com` with the email associated with your GitHub account.

To verify:

```
git config --global --list
```

Step 2: Make the initial commit again

Since the first commit failed, stage your files and commit:

```
git add .
git commit -m "Initial commit"
```

If it succeeds, you'll see something like:

```
[main (root-commit) abc1234] Initial commit
```

Step 3: Rename the branch (if needed)

```
git branch -M main
```

Step 4: Push to GitHub

```
git push -u origin main
```
